9 Treatment of FCTR Cashflow 34
9.1 Navigation 35

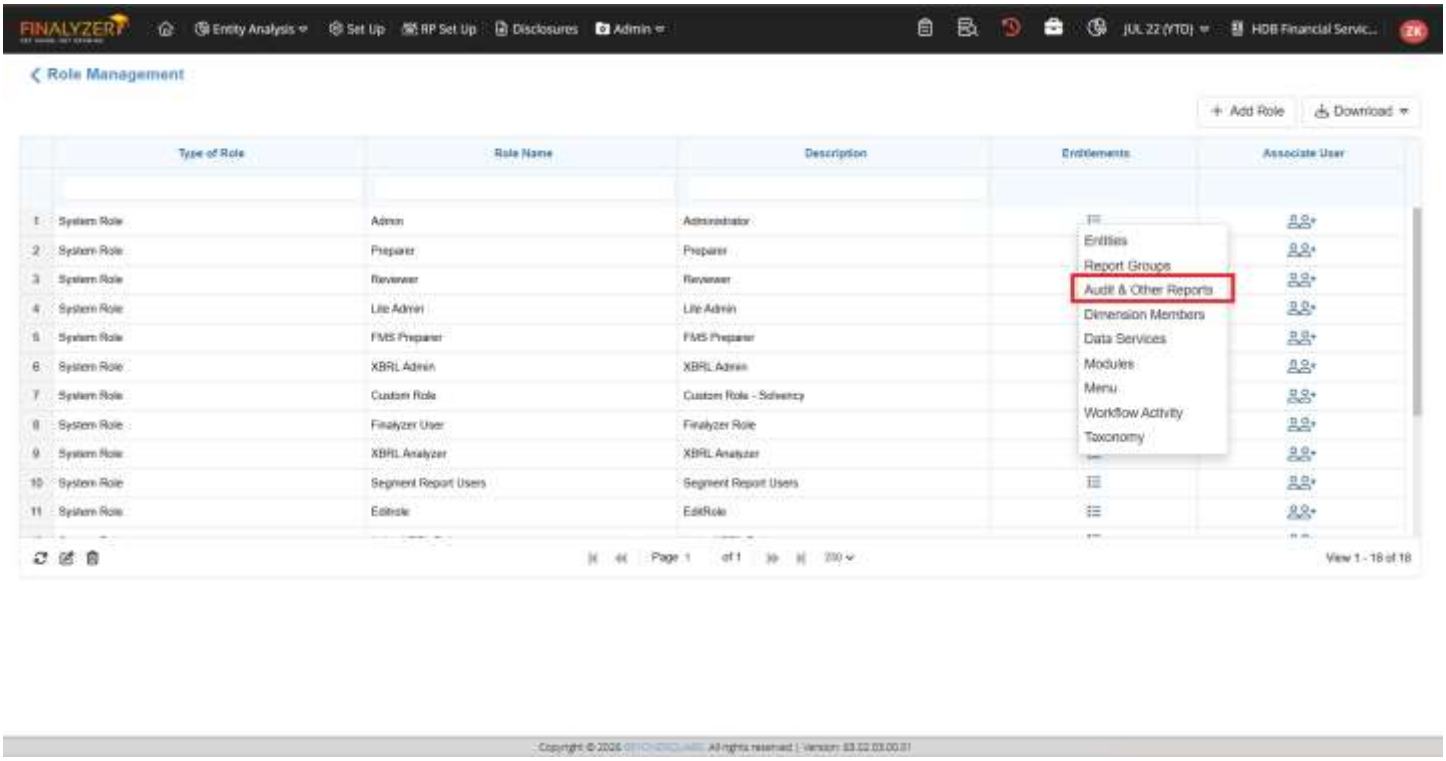
1 Audit Report

A few new **Audit Reports** have been introduced to provide visibility into changes made across various entities in the system. This helps in tracking modifications and maintaining accountability.

1.2 Access Configuration

To enable access to Audit Reports for a user role:

1. Navigate to:
   Admin → User Role Management → Manage Roles → Entitlements → Audit & Other Reports
2. Identify the required audit reports.
3. Grant access to the selected reports for the desired role.



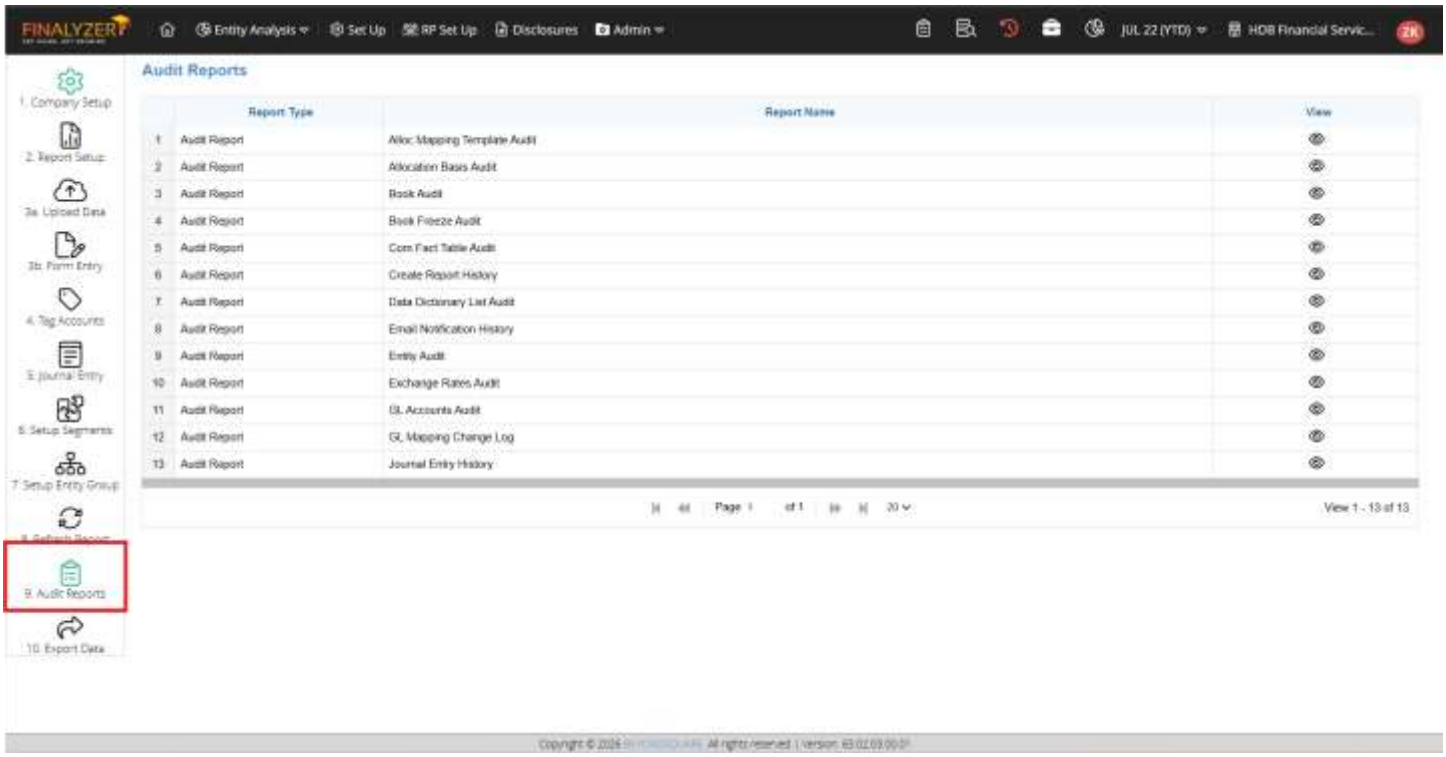
1.3 Accessing Audit Reports

Once access is configured:

Navigate to:

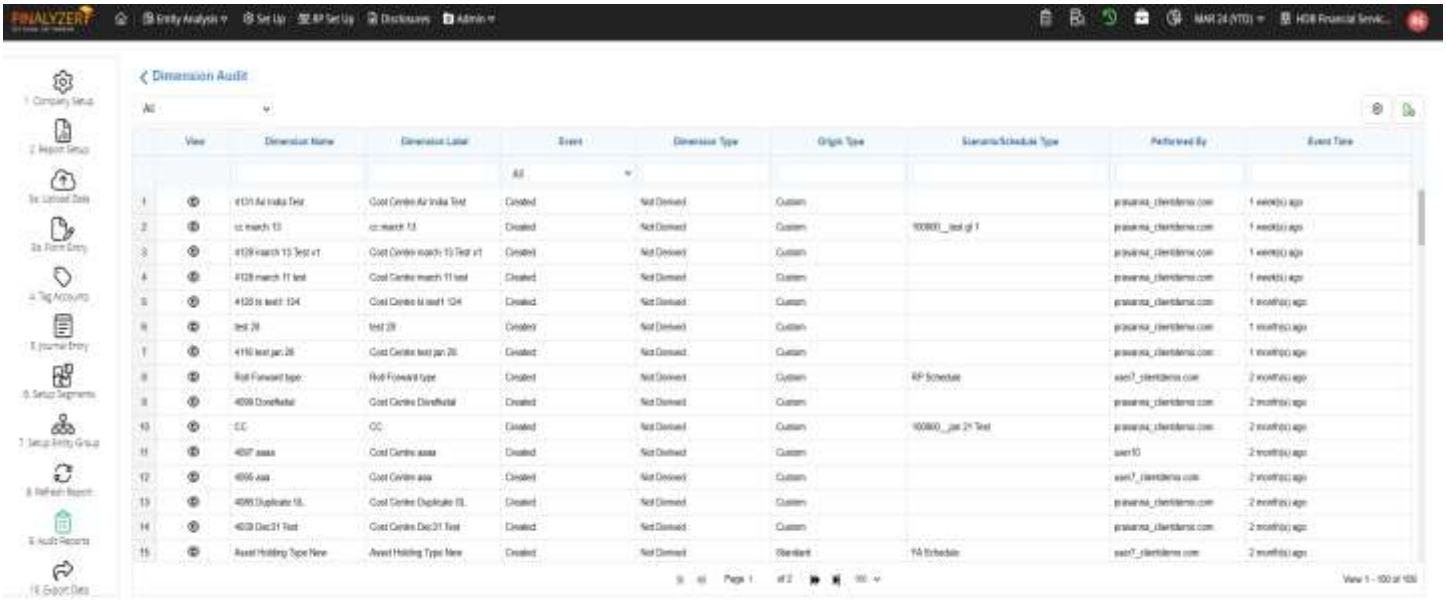
Top Bar (Setup) → Audit Reports (Left Pane)

1. Users will see only those reports for which their role has been granted access.

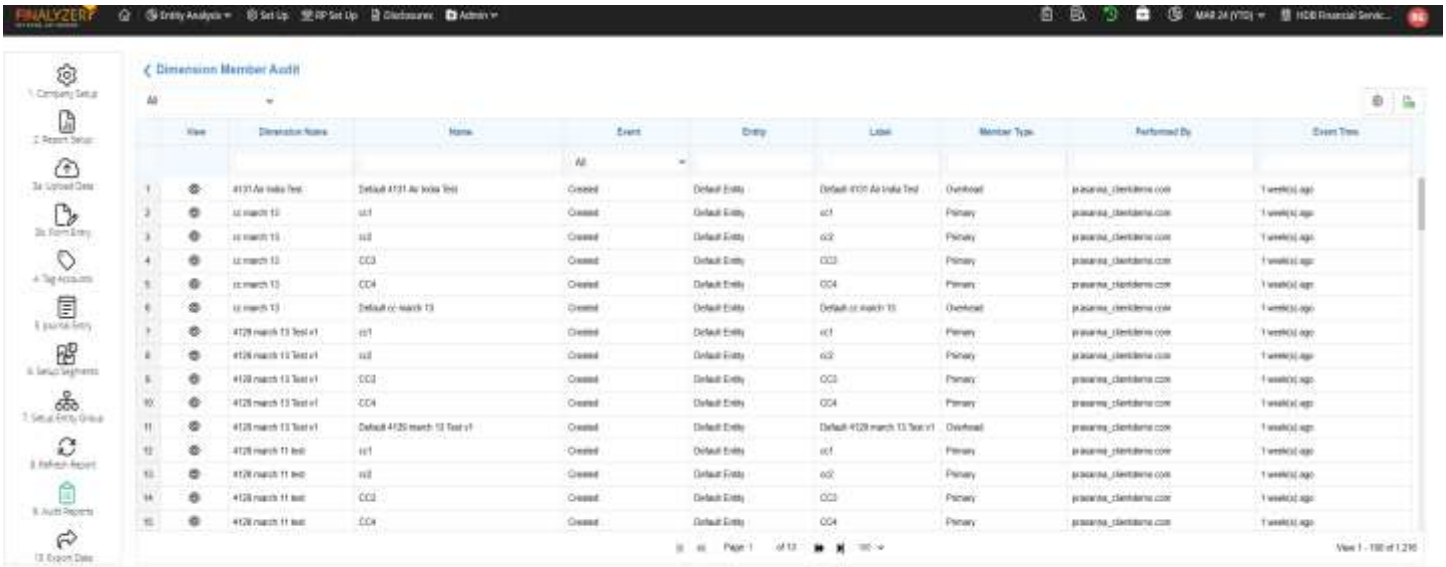


1.4 Newly added Audit Reports

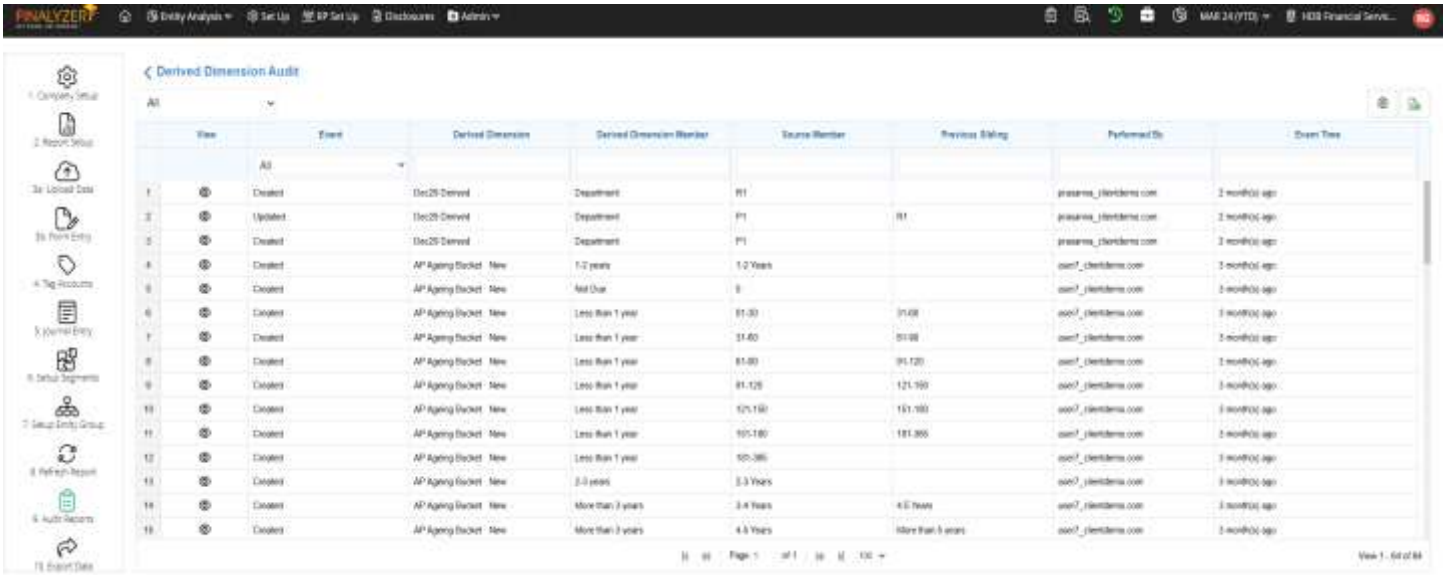
- **<u>Dimension Audit</u>** - Tracks the history of changes to **dimension definitions** (dimension name and label, taxonomy, how the dimension applies to entities, type, origin, linked domain, default member, and related setup). It answers what changed, when, and by whom for **dimension master configuration**—not each member row under the dimension.



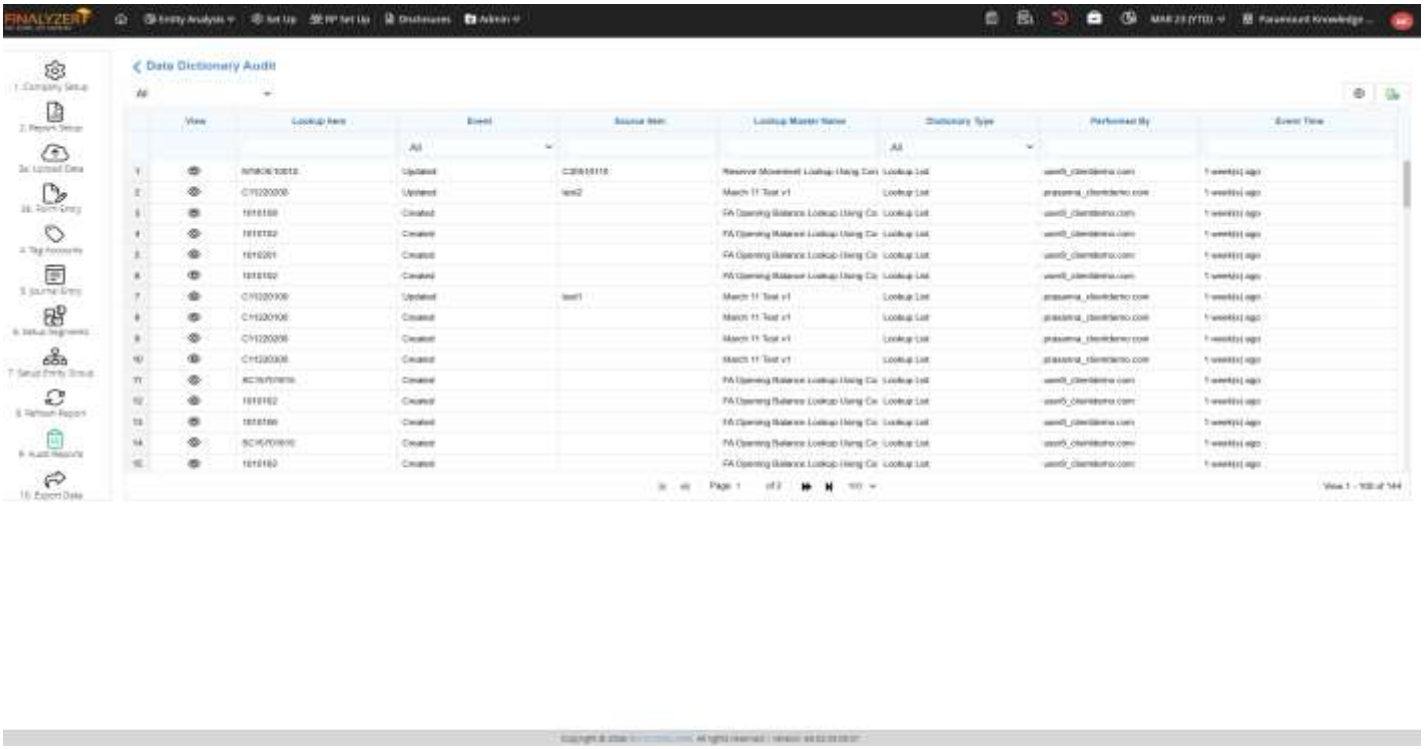
- **<u>Dimension Member Audit</u>** – Tracks the history of changes to **taxonomy dimension members** (individual members under a dimension: names, labels, entity, business keys, status, origin, member type, and related attributes). It supports governance and troubleshooting when member lists used in reporting or mappings are added, edited, or removed. It does **not** replace the dimension **definition** itself



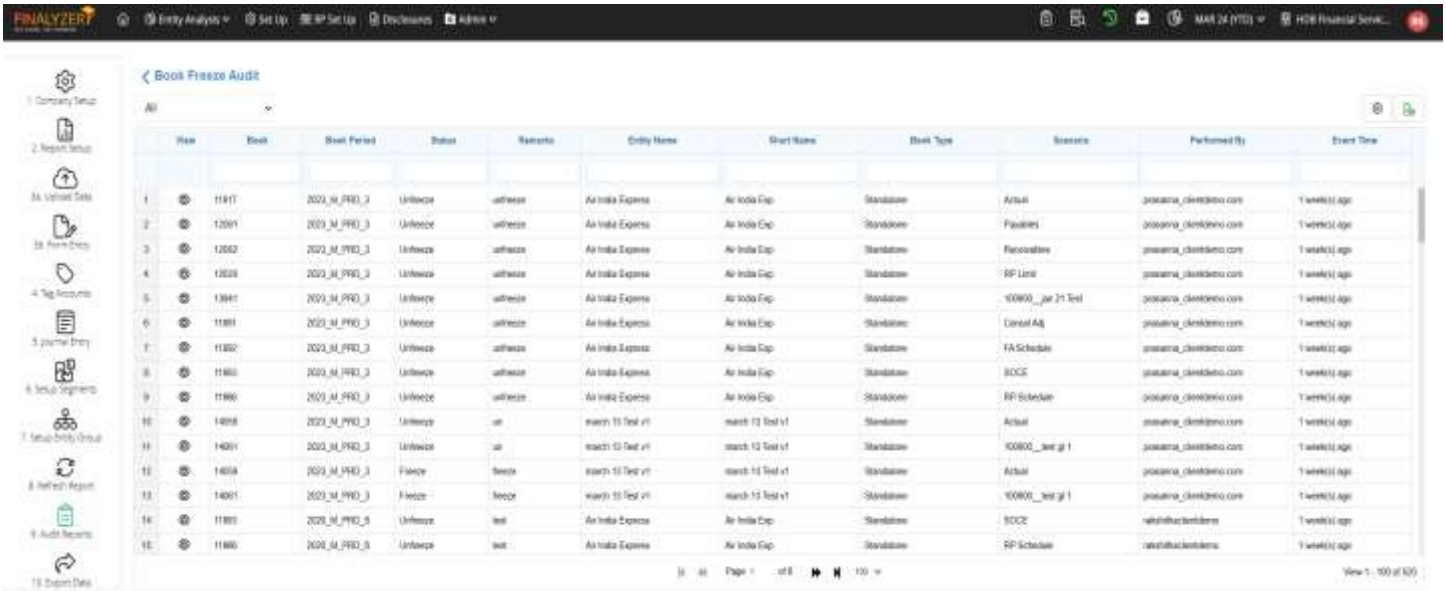
- **<u>Derived Dimension Audit</u>** - Tracks the history of changes to **derived-dimension relationships** (how derived members link to source members, previous sibling, derived dimension, order, and related fields). It supports review when **calculated or hierarchically derived member** setups change. It is **not** a full history of every plain dimension member edit—use Dimension Member Audit for that.



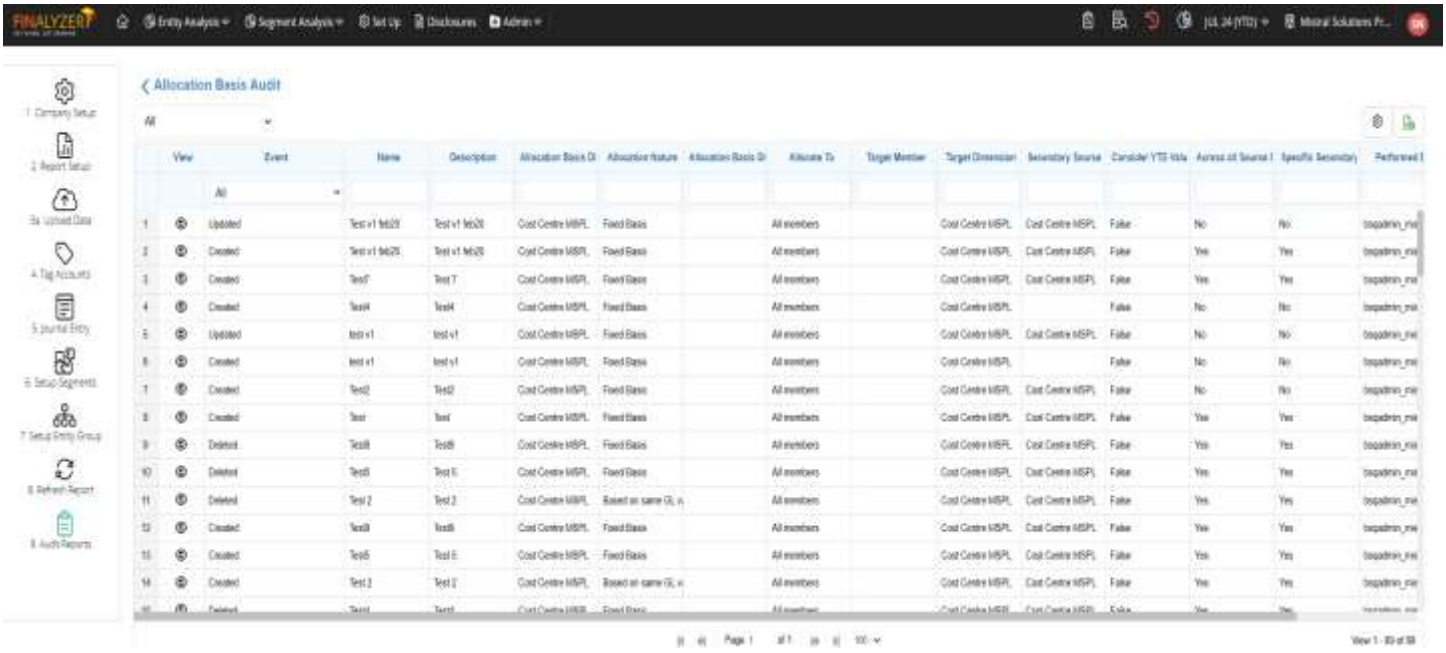
- **<u>Data Dictionary Audit</u>** - Tracks the history of changes to **data dictionary** definitions (masters, lookup lists, allowed values, and detail rows used in imports, mappings, and validations). It supports **governance and troubleshooting** when lookups or allowed lists are added, edited, or removed.



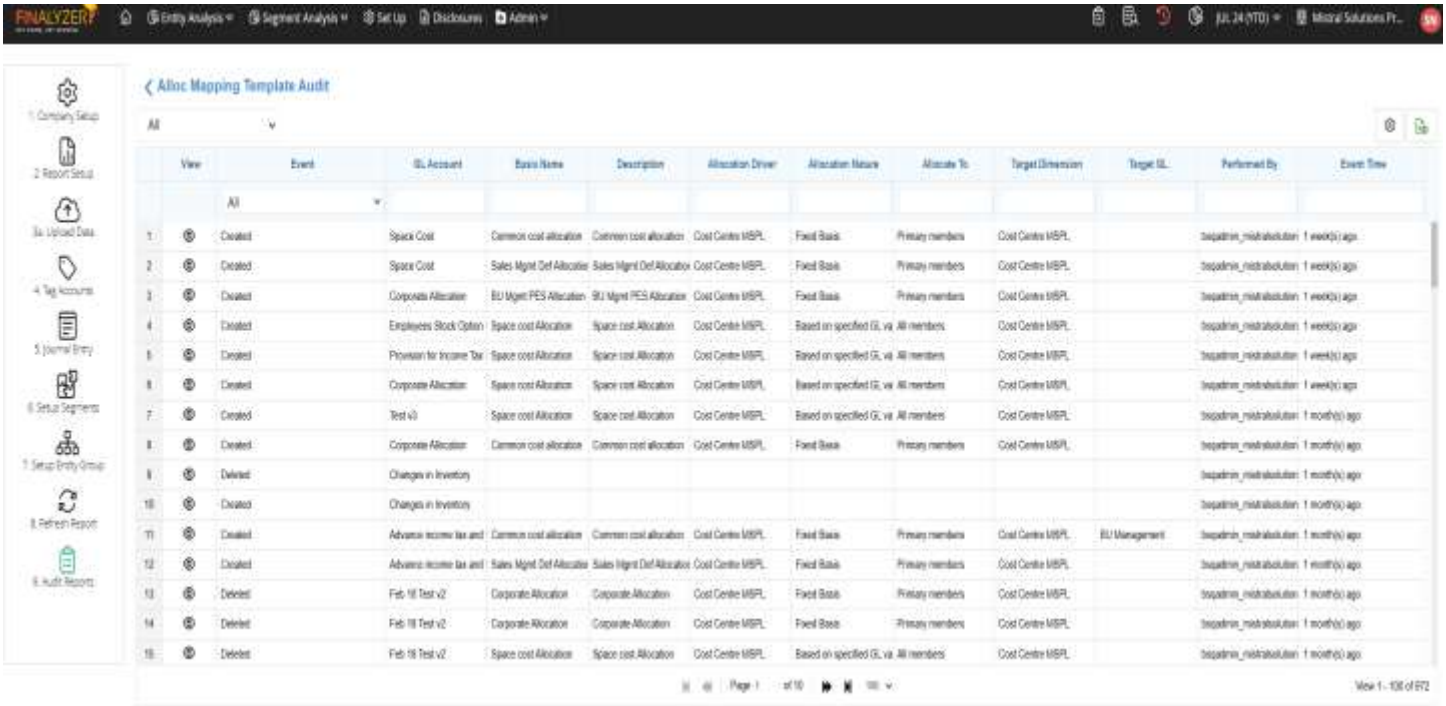
- **<u>Book Freeze/Unfreeze Audit</u>** - Tracks the history of **book freeze and unfreeze actions** by book and period (status, remarks, freeze option, trigger book, entity and book context such as scenario and nature of report). It supports **period close control and audit** of who locked or unlocked a book for a period. It does **not** list changes to general ledger balances or journal entries—only **freeze/unfreeze events** and their metadata.



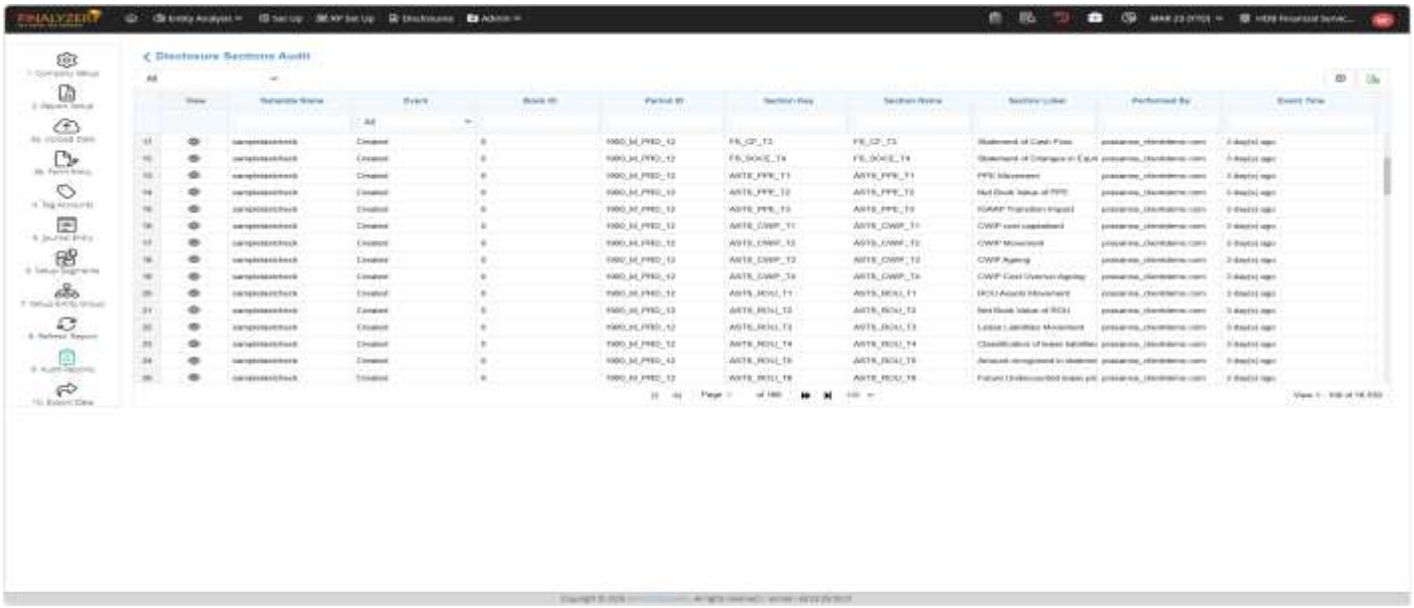
- **<u>Allocation Basis Audit</u>** - Tracks the history of changes to **allocation basis definitions** (basis name and description, allocation driver dimension, allocation nature, basis GL, grouping, target members and dimensions, secondary source dimension, YTD and cross-dimension options, and related settings). It supports governance when **rules that drive how allocations are calculated** are adjusted. It does **not** show every **per-account mapping** on a template—that is covered by Alloc Mapping Template Audit.



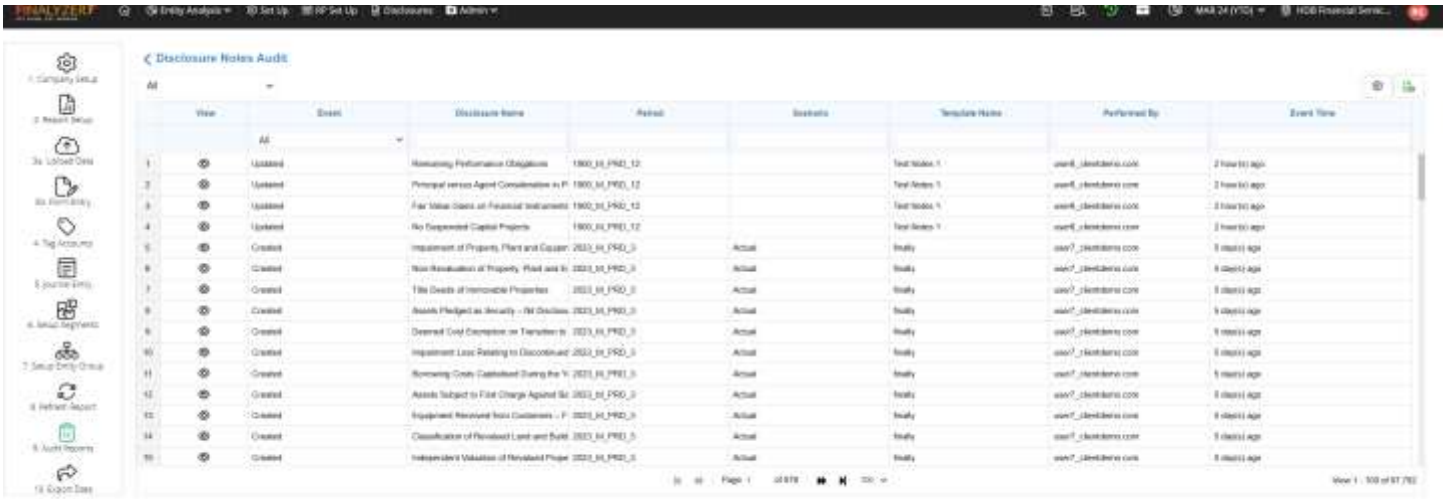
- **<u>Allocation Mapping Template Audit</u>** - Tracks the history of changes to **allocation template mappings** (which GL or source item maps to which basis, target GL, allocation type, and the resolved basis details such as driver, nature, and target dimension). It answers what changed, when, and by whom for **line-level allocation template** configuration tied to an allocation template.



- **<u>Disclosure Sections Audit</u>** - Tracks the history of changes to **disclosure_section_master_sheet** (structure, links to reports/ templates, and related master data used in disclosure reporting). It answers **what changed, when, and by whom** for disclosure section configuration—not the numeric disclosure numbers themselves.



- **Disclosure Notes Audit** - Tracks the history of changes to **disclosure note records** (disclosure name, linked book, output report template, period, narrative content, scenario, nature of report, and related metadata). It supports governance and troubleshooting when **disclosure text and its linkage** to books, templates, and periods are created or updated.



Report Behavior

- Each report displays entries corresponding to changes made to the respective items.
- Records are displayed in **descending order of recency**, with the most recent changes appearing first.

Key Benefit

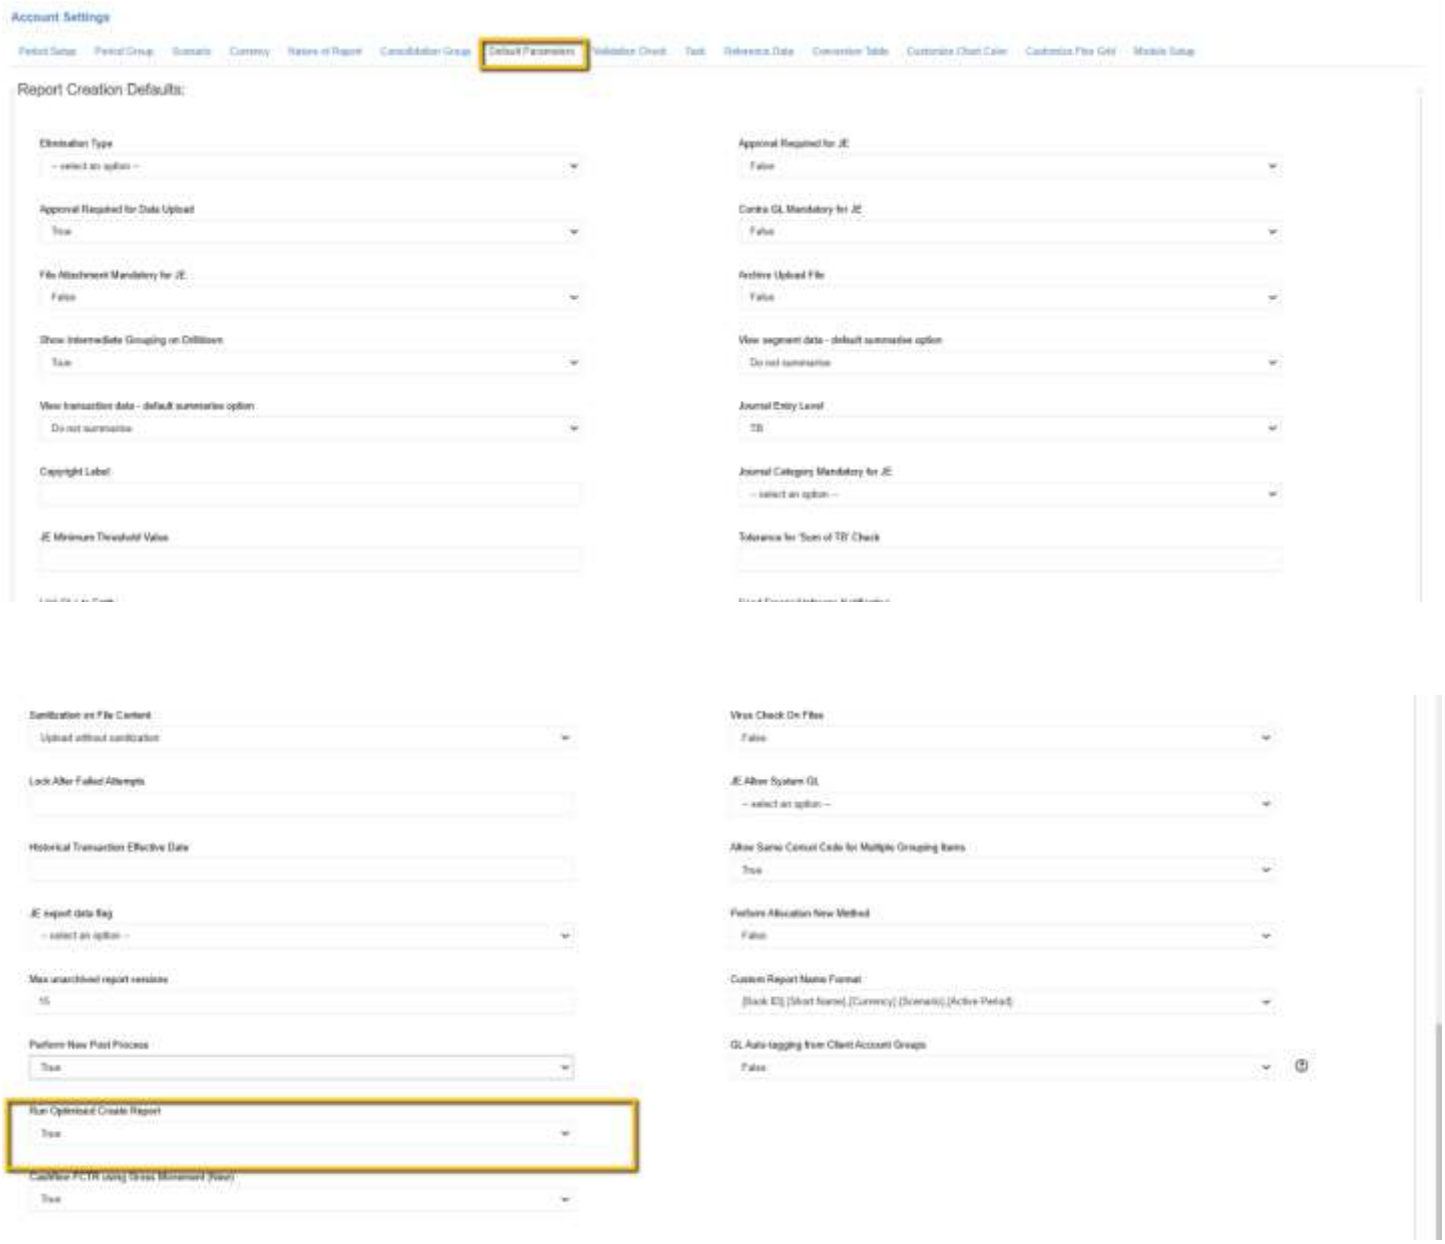
This feature enhances transparency by allowing users to monitor and review system changes efficiently.

2 Run Optimised Create Report

2.1 Navigation Path

Admin → Account Settings → Default Parameters → Run Optimised Create Report → Set to "True"

2.2 Configuration Screen



Description

The Run Optimised Create Report feature enhances report refresh performance by executing only the necessary updates instead of processing all books every time.

Functionality

When Run Optimised Create Report = True:

1. Selective Refresh Execution: The report refresh runs only for entities where data changes have occurred, reducing unnecessary processing and improving performance.
2. Full Refresh on Configuration Changes: The report refresh runs for all books if there are configuration changes such as Taxonomy tree updates, GL mapping changes, or other structural/configuration modifications.

Benefits

- Faster report generation
- Reduced system load
- Improved efficiency by avoiding unnecessary full refresh

Notes

- Recommended to enable this option in environments with large data volumes.

3 ORT-level Disclosure section and notes

Disclosure sections apply to your output report template (ORT) and then adding notes under those sections.

<u>How the two steps fit together</u>

For a given output report template, you typically work in this order:

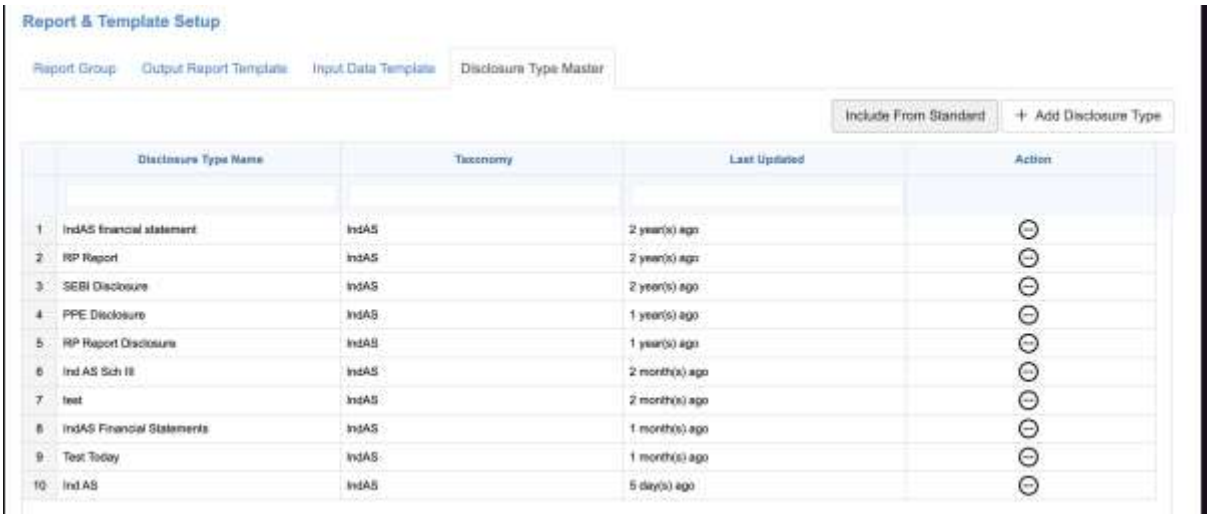
1. **Disclosure Sections Setup** — Choose the sections that belong to this template (by copying from the master list) and arrange their order. Sections are grouped (e.g. by section group) in a tree.

2. **Disclosure Notes** — For those same sections, add or import notes (and sub-notes) and publish so reporting uses your text and hierarchy.

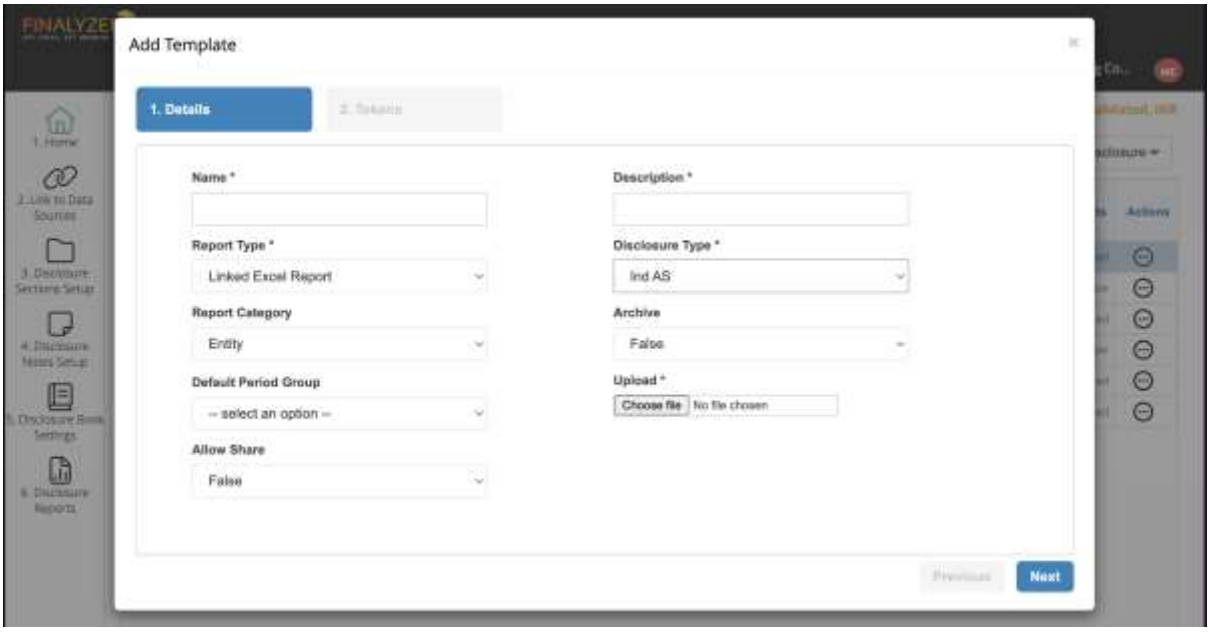
Both screens use the same active disclosure template as the Report Template tab in Disclosure Setup (and the same session selection elsewhere). If the wrong template is selected, you will edit the wrong ORT.

3.1 Before you start(both screens)

1. Inside the Report and Template Setup go to Disclosure Type Master to include the standard disclosure if you have not done so already.



2. This disclosure type needs to be assigned to a disclosure of type Linked Excel Report (Add new disclosure)



3. Select the disclosure and open Disclosure Sections Setup and/or Disclosure Notes as described below.

If no template is selected, these screens show a message to select a disclosure template first.

3.2 Part 1 – Disclosure Sections Setup

This screen manages which sections appear for your ORT and in what order. Notes in Part 2 attach to these sections.

How to open it

- Use the side menu: Disclosure Sections Setup (if enabled for your role).

The page title is Disclosure Sections Setup. A short hint on the page explains that the tree shows sections for the selected disclosure template.

> Note: In Disclosure Setup, the Disclosure Section tab opens a different screen if you're disclosure is of type Linked Word Report instead of Linked Excel Report. Disclosure Sections Setup is the ORT-focused tree where you include sections from master and publish order for the current template.

Understanding the sections tree

Sections are listed in order within each group (by sequence). The legend at the bottom labels Section Group and Section.

Add sections from master

Your organization maintains master sections at the disclosure type level. You copy the ones you need into this template.

1. Click Add from Master.

2. The Add Sections from Master dialog opens with a grid: Section Label, Section Name, Section Group, and Include (checkbox).

3. Optional: use Filter by Section to limit rows by section group (helpful for long lists).

4. Select sections with Include. You can use Select all in the header to select all visible rows after a filter.

5. Click Include to copy the selected sections into this template. On success, the tree refreshes.

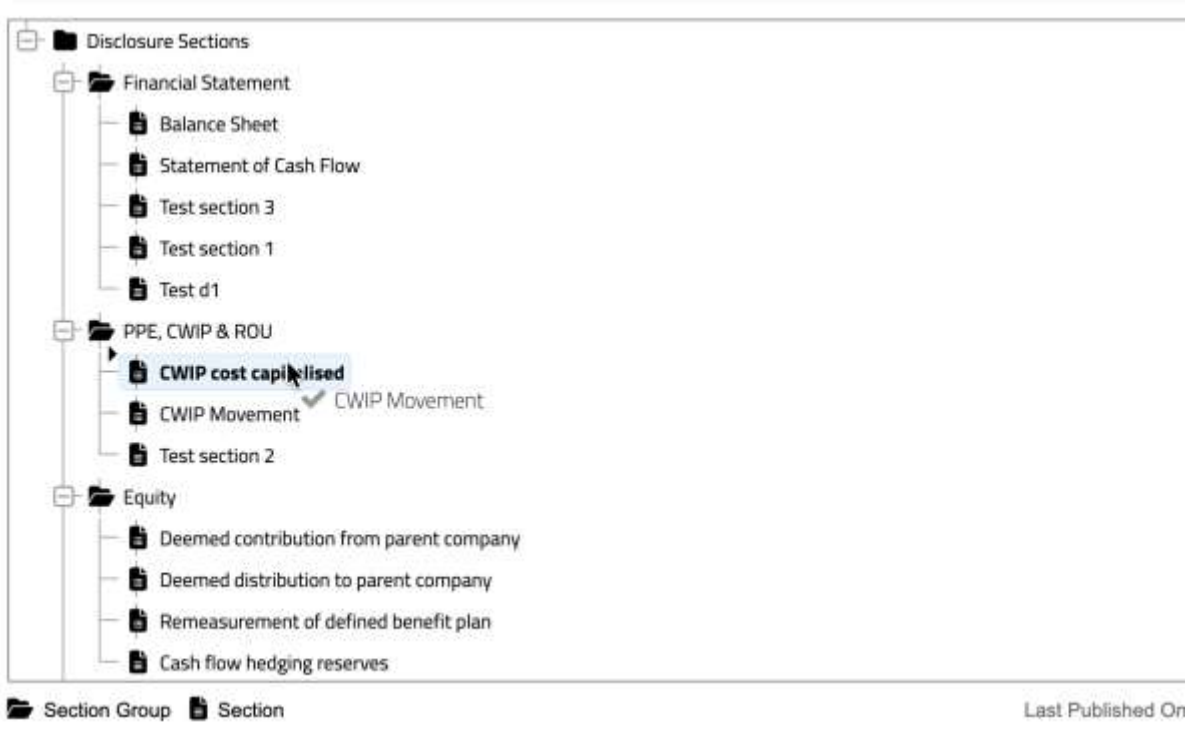
If you select nothing, the screen may ask you to choose at least one section.

	Section Label	Section Name	Section Group	Include
1	Statement of Profit and Loss	FS_PL_T2	Financial Statement	☐
2	Statement of Changes in Equity	FS_SOCE_T4	Financial Statement	☐
3	CWIP Ageing	ASTS_CWIP_T3	PPE, CWIP & ROU	☐
4	CWIP Cost Overrun Ageing	ASTS_CWIP_T4	PPE, CWIP & ROU	☐
5	PPE Movement	ASTS_PPE_T1	PPE, CWIP & ROU	☐
6	Net Book Value of PPE	PPE Movement _PPE_T2	PPE, CWIP & ROU	☐
7	IGAAP Transition Impact	ASTS_PPE_T3	PPE, CWIP & ROU	☐
8	ROU Assets Movement	ASTS_ROU_T1	PPE, CWIP & ROU	☐
9	Net Book Value of ROU	ASTS_ROU_T2	PPE, CWIP & ROU	☐
10	Lease Liabilities Movement	ASTS_ROU_T3	PPE, CWIP & ROU	☐
11	Classification of lease liabilities	ASTS_ROU_T4	PPE, CWIP & ROU	☐
12	Amount recognised in statement of profit and loss	ASTS_ROU_T5	PPE, CWIP & ROU	☐
13	Future Undiscounted lease payable	ASTS_ROU_T6	PPE, CWIP & ROU	☐
14	Future Undiscounted lease receivable	ASTS_ROU_T7	PPE, CWIP & ROU	☐
15	Undiscounted potential future rental payment	ASTS_ROU_T8	PPE, CWIP & ROU	☐

Reorder sections (drag and drop)

You can drag section rows to change order within the same section group. You cannot drag sections into a different group or move group folders from this tree (the tree restricts moves that would change parent).

Use this when you want a custom order for disclosure numbering or layout.



Publish (sections)

When the section list and order are correct:

1. Click Publish.

2. The system saves section order and publishes the section structure used downstream (together with the disclosure tree content for this master level).

Last Published On and Modified On show when the template was last published versus last changed. If nothing changed since the last publish, Publish may stay disabled until you make a change.

3.3 Part 2 – Disclosure Notes

After sections exist for the template, use Disclosure Notes to add textual notes under each section.

How to open Disclosure Notes

Use the side menu Disclosure Notes Setup (if enabled).

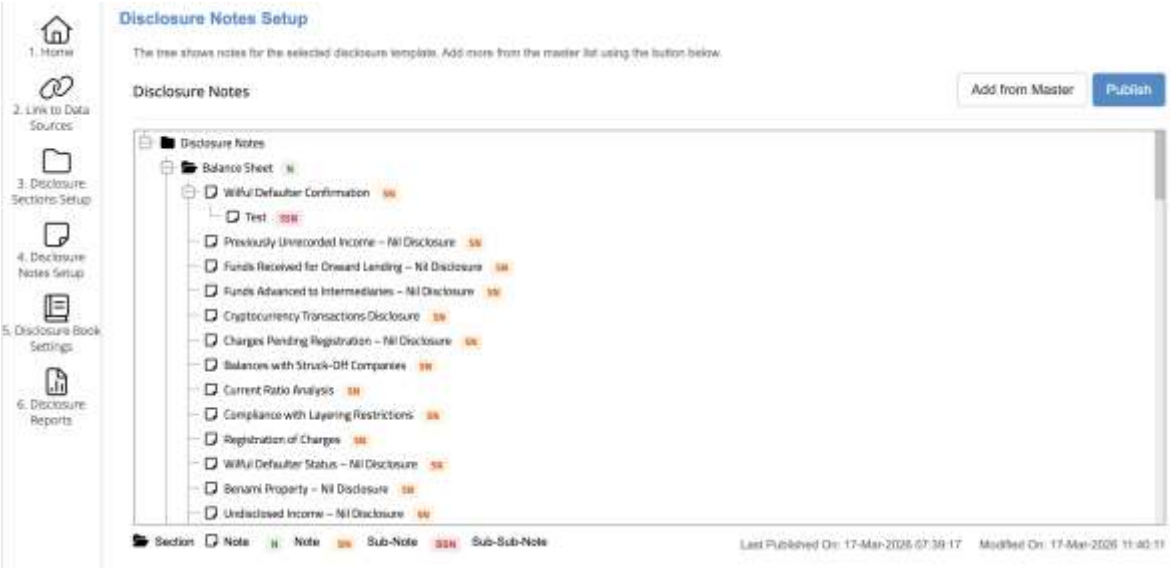
Again, the data is always for the currently selected disclosure / output report template.

Understanding the notes tree

- Section rows (folder icon) are the same ORT sections you configured in Part 1. They appear in order by section sequence.

- Note rows (note icon) belong to one section. Under each section, notes are ordered by sequence and parent/child links.

- Badges: N = Note, SN = Sub-note, SSN = Sub-sub-note. The legend at the bottom explains them.



<u>Working with notes (right-click / context menu)</u>

On a section

- Add note — Opens Add Note for that section (under the section or under another note, depending on the dialog).

On a note

- Add note — Add another note in the section (child or sibling, per dialog).

- Edit note — Change name, content, and relation to a reference note.

- Delete note — Removes the note (per your org's confirmations).

Add Note and Edit Note dialogs

Name — Label in the tree.

Content — Body text.

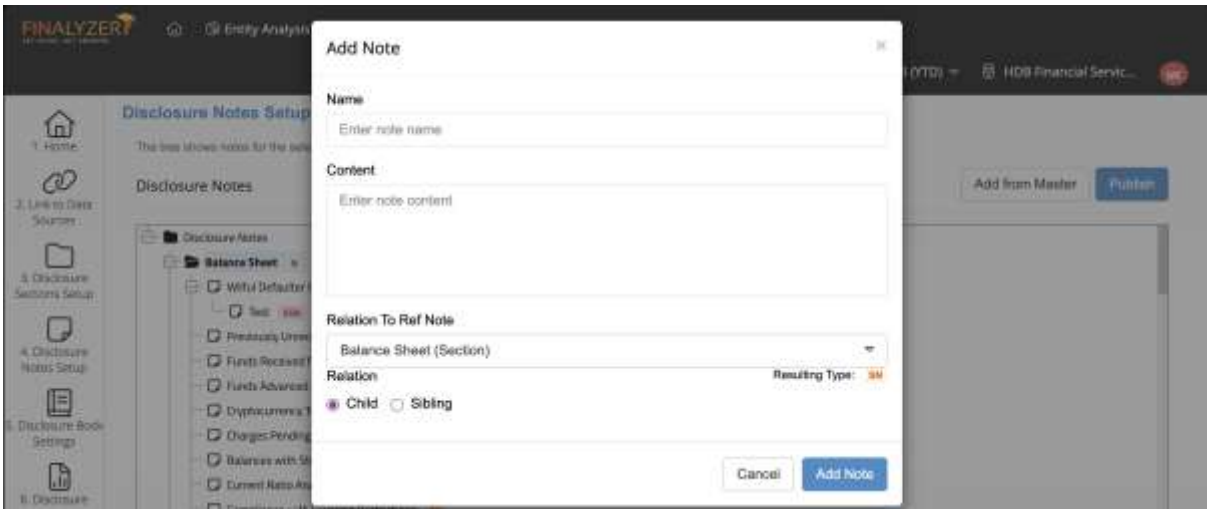
Relation To Ref Note — Relative to the section or an existing note in that section.

Relation

- Child — Under the reference (e.g. sub-note under a note). Resulting Type shows N / SN / SSN; you cannot add a child under a sub-sub-note (warning appears).

- Sibling — Same level as the reference.

Use Add Note or save on Edit Note; Cancel closes without saving.



Bringing in notes from master ("Add from Master")

Master notes live at the disclosure type level. You copy selected ones into this ORT.

1. Click Add from Master.

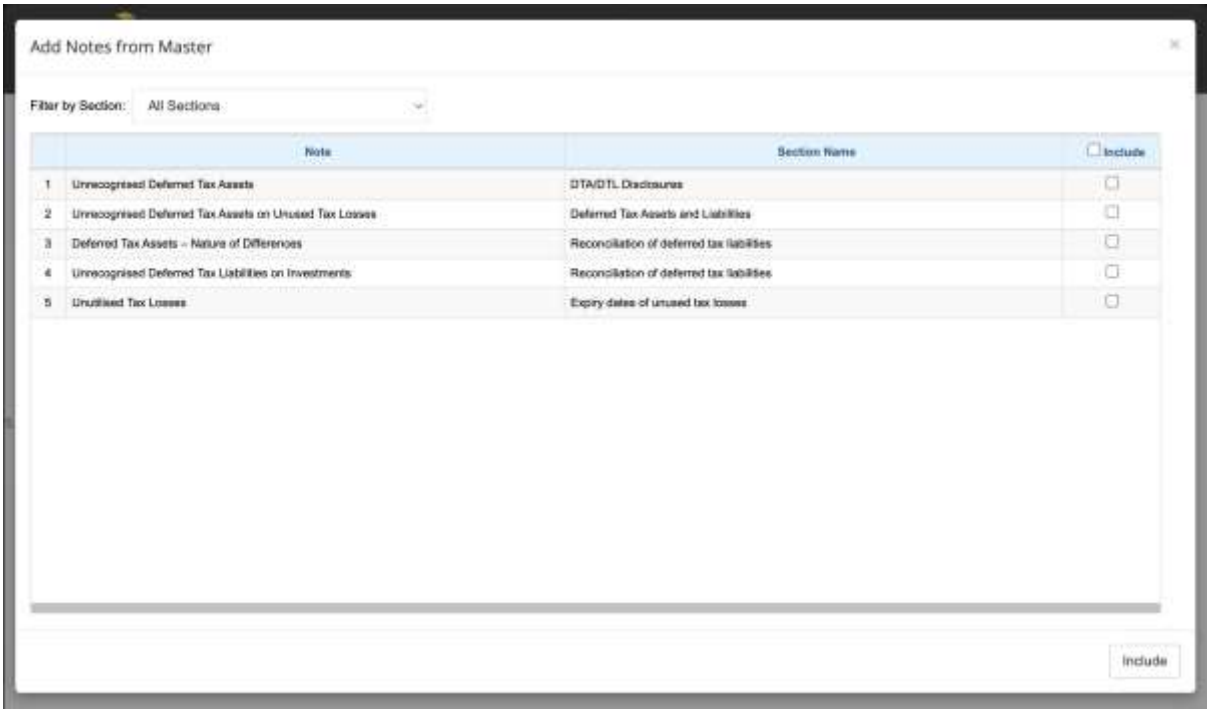
2. Add Notes from Master lists Note, Section Name, and Include.

3. Filter by Section narrows the list.

4. Select with Include (and Select all visible if needed).

5. Click Include to copy into this template.

Duplicates or conflicts may show a message (e.g. duplicate name).



Publish (notes)

Click Publish when the note tree and order are ready so reports and exports use this version.

Last Published On and Modified On behave like the sections screen; Publish may be disabled until there are changes after the last publish.

Some important points to remember

1. Do sections before notes — If a section is not included for the ORT, you cannot attach notes to it in the notes tree.

2. Confirm the template on Disclosure Home screen before opening Sections Setup or Notes.

3. Master first, then tailor — Use Add from Master on both screens for a quick baseline, then reorder sections and edit notes locally.

4. Order matters on both trees; Publish on each screen when you want downstream consumers to see that version.

After sections and notes have been configured and published, you can prepare the report from Reports and Analytics > Excel Disclosure screen and download it to get the sections and notes inside excel where you can edit them for the specific book and period.

4 RP Changes

4.1 Executive Summary

This release introduces key improvements to Related Party (RP) reporting, elimination logic, and consolidation data visibility. The enhancements ensure greater accuracy, better control over eliminations, and improved clarity in reporting.

Users will benefit from:

- More accurate and consistent RP data
- Clearer elimination reports
- Enhanced control using the **IC Elimination Required** flag
- Improved visibility into consolidation and mirror book data

Additionally, enhancements to mirror book handling and the introduction of a consolidated view help reduce duplication and streamline analysis.

4.2 Fixes & Improvements

1. RP IC Elimination Report – Grouping Fix

- Resolved an issue where transactions were not grouped correctly in the elimination report
- Transactions are now grouped based on **source counterparty entities**
- Improves report clarity and usability

---

2. Related Party Association Population

- Fixed inconsistencies in populating related party associations
- Ensures RP data is now **accurately and consistently available** across processing and reporting

---

3. Custom Post-Process Enhancements

- Addressed gaps in the custom post-process implementation
- Ensured correct application of output mappings
- Results in **accurate and reliable processed data**

Behavioral Change

4. IC Elimination Required Flag Handling

- Updated elimination logic to strictly respect the **IC Elimination Required flag**

Previous Behavior:

- Transactions were automatically considered for elimination if the counterparty was part of the consolidation structure

Current Behavior:

- Transactions are eliminated **only when the flag is enabled**

Benefit:

- Provides greater control and aligns with expected business behavior

---

Enhancements

5. Mirror Book Data Handling

- Eliminated transactions in the consolidation book are **no longer created in the mirror book**
- Reduces data duplication
- Ensures cleaner and more accurate data representation

---

6. Mirror Book View in Consolidation

- Introduced a **Mirror Book view within the consolidation book**

- Allows users to view transactions **not eliminated** in the current consolidation
- Eliminates the need to switch between books
- Improves analysis efficiency and visibility.

5 Excel Disclosure (Period Specific)

Excel Disclosure under **Report and Analytics** follows the same implementation as the **Master screen**, but all data in this screen is **Book and Period specific**.

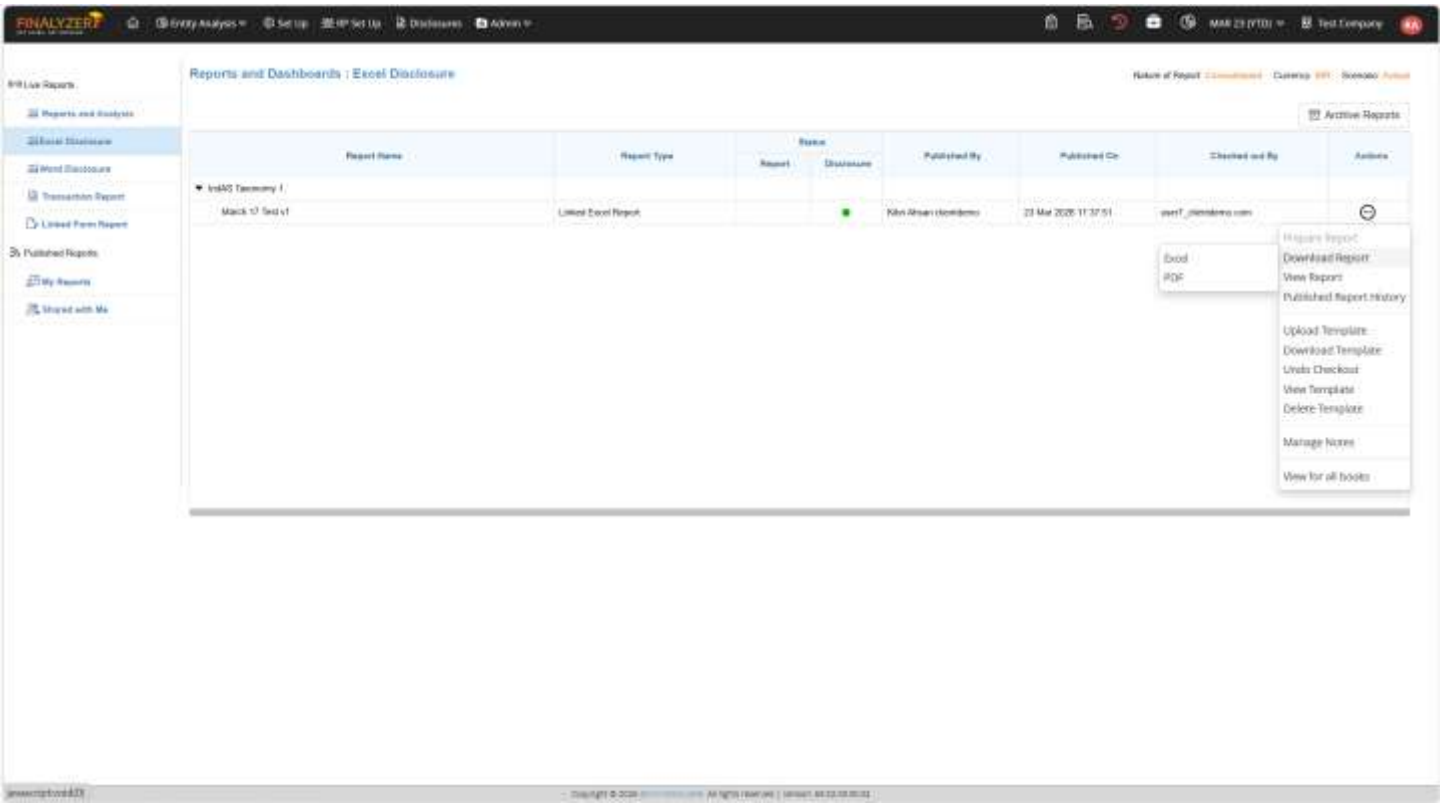
5.1 Template Creation

When a new template is created in **Report and Template Setup** and assigned to a **Role** and **Book**, it will appear in the **Excel Disclosure** screen. Initially, no **period-specific template** exists. Once the user triggers **Prepare Report**, the **Master Template** is copied as a **Period-specific Template** and the corresponding **Report** is generated.

Users can perform **CRUD operations** on these templates, which will apply only at the **Book and Period level** and will not affect the **Master Template**.

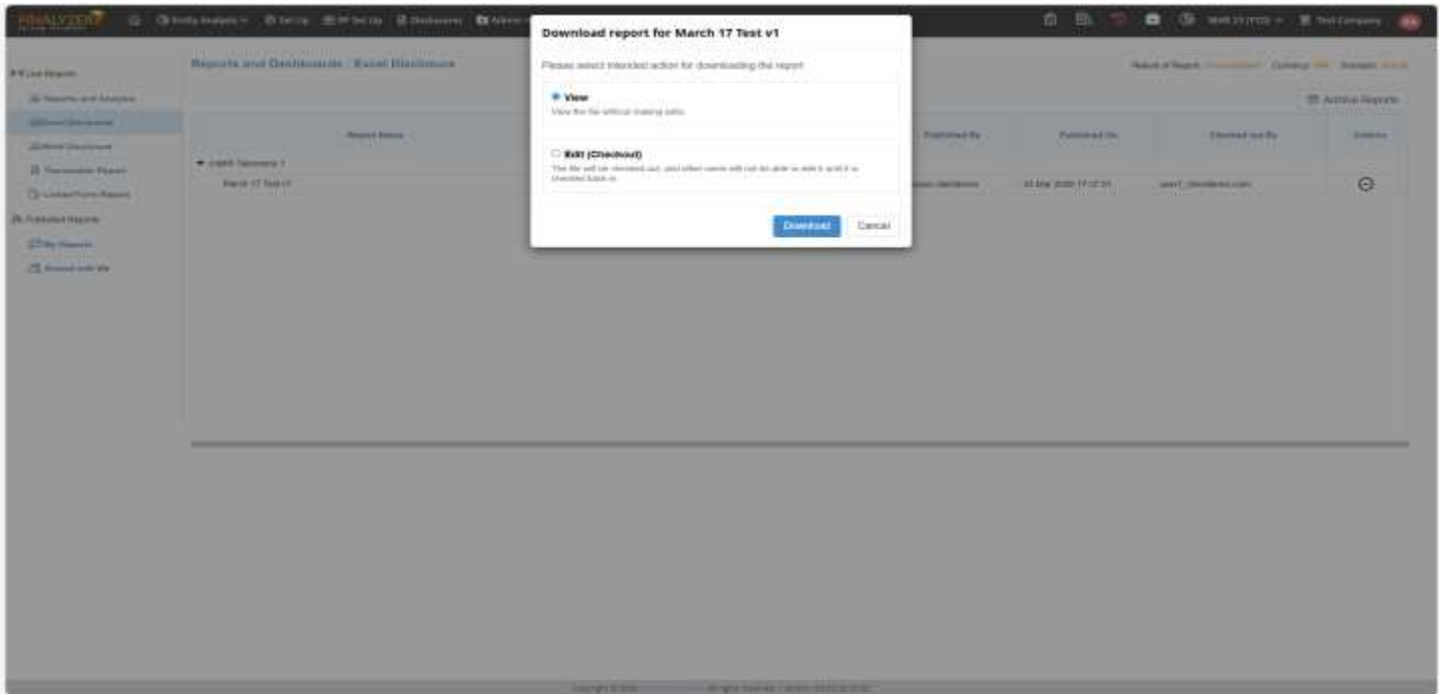
5.2 Download Functionality

- **Reports** can be downloaded in **PDF or Excel** format.
- **Templates** can be downloaded in **Excel** format only.



When downloading a **template or Excel report**, users must choose between:

- **View** – File can be downloaded only for viewing and cannot be uploaded back.
- **Edit (Checkout)** – File can be downloaded for editing and uploaded back.



If a user **checks out** a template/report, other users cannot download it for **edit** until it is **checked in** (uploaded back).

5.3 Online view / Edit

Users can **view and edit templates or reports online** instead of downloading them.

- If a file is **checked out**, other users cannot **save changes via WOPI**.
- Any **template changes via WOPI** will mark the **report as outdated**, and **Prepare Report** must be executed again to generate the latest report.

Delete Template

Deleting a template removes it only for the **current Book and Period** and does not affect the **Master Template**.

Upload Functionality

Templates and reports can be uploaded through:

- **UI**

- **Excel Add-in**

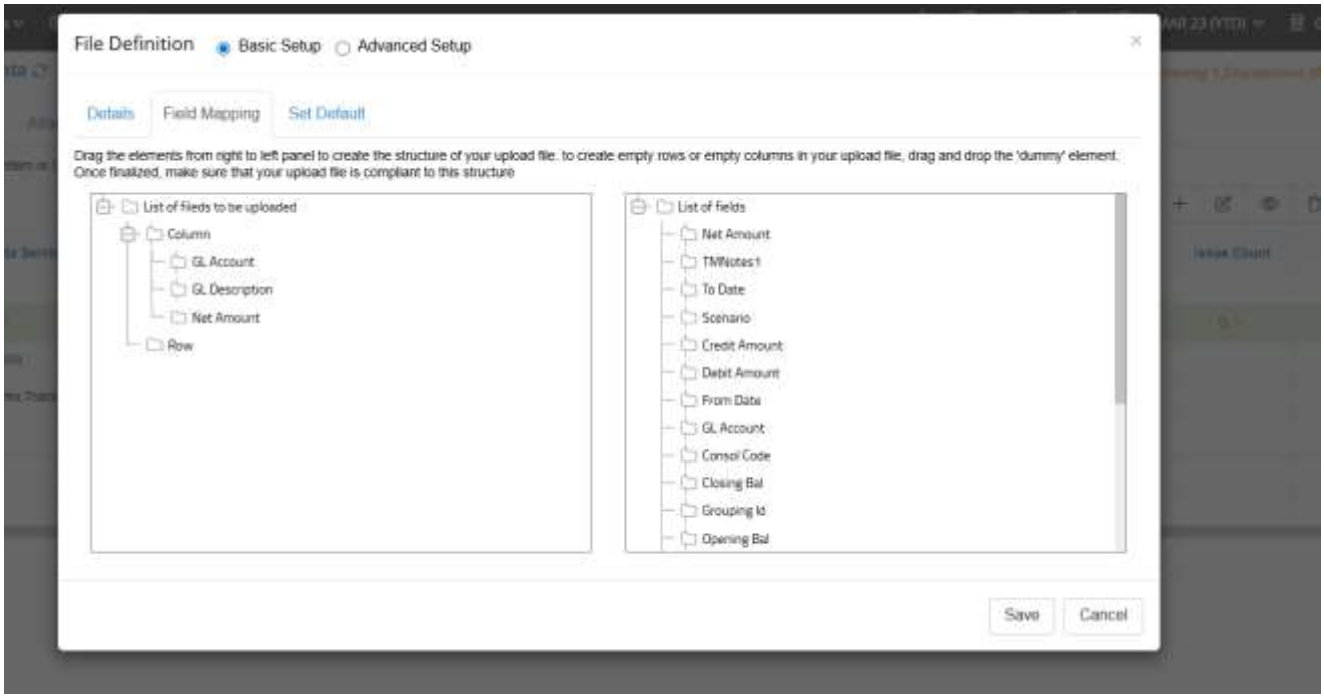
Users can either upload **once (check-in)** or upload **multiple times** by selecting **Upload Without Check-in**.

Screen Update

The **Entity Analysis** screen will now contain only **ORT reports**.
Reports with **report_type = 'ERG'** are available under **Report and Analytics → Excel Disclosure**.

6 Supporting opening Balance Upload TB and segment balance

- Introduced functionality to upload **Opening Balances** directly into both the **Trial Balance** and **Segment Trial Balance**.



7 Pdf Download

7.1 Overview

- You can download published disclosure reports as a **PDF file**.
- The system converts the original Excel file into PDF on the server.
- This helps users:
    - View reports without Excel

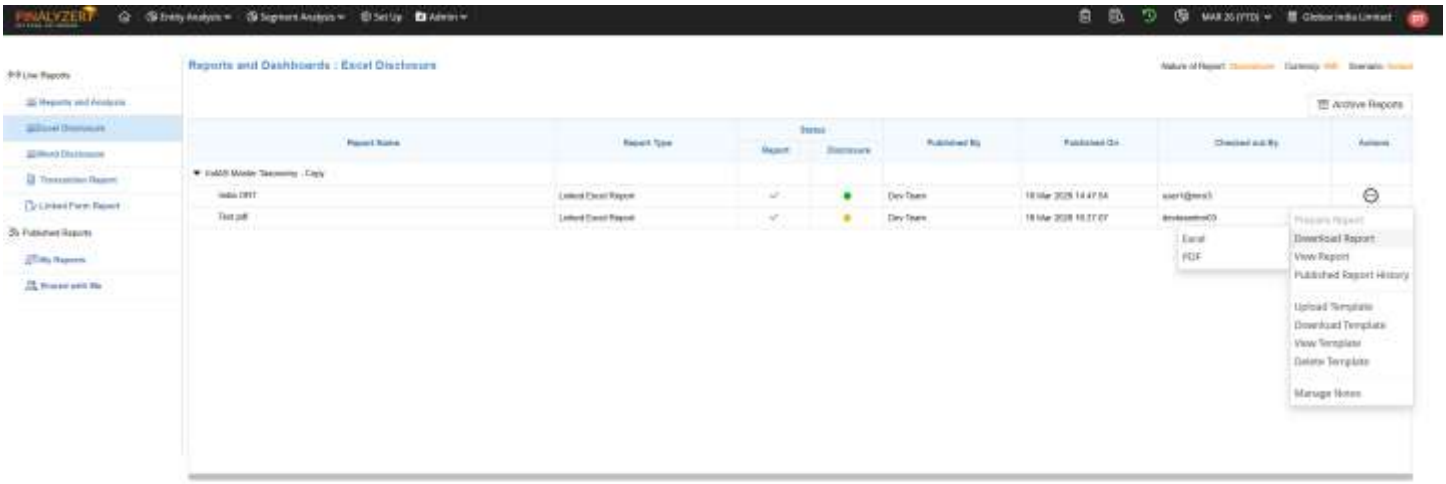
- Share a fixed (non-editable) format

Important:

- This feature is only for **published disclosures**
- It **does not change the report data**, only the format
- Excel download is still available separately

7.2 Navigation Path

Reports and Analytics --> Excel Disclosure --> Download Report --> Pdf



8 Four Way workflow

We have introduced a structured approval process to enhance accountability and compliance. The workflow now includes the following stages:

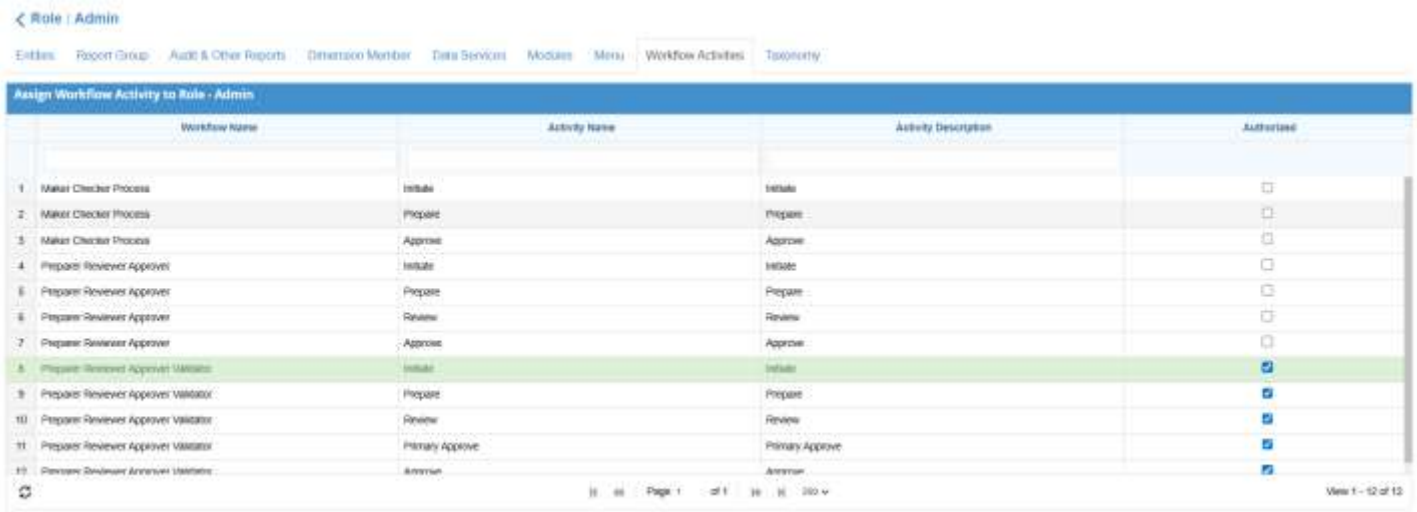
- **Preparer** → Drafts and submits the initial request/document.
- **Reviewer** → Validates accuracy and completeness.

- **Approver-1** → Provides managerial/technical approval.
- **Approver-2** → Final sign-off authority.

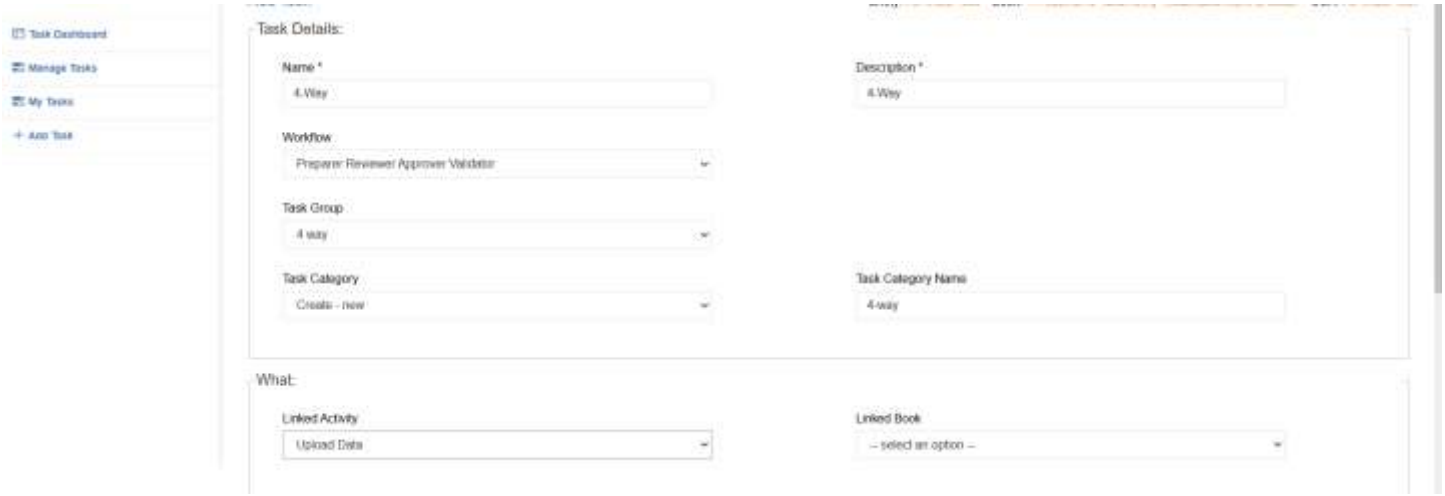
This enhancement ensures clear responsibility at each stage, reduces errors, and provides a transparent audit trail for all approvals.

8.1 Navigation:

Administrators can now configure access for the new four-way approval workflow directly in **User Role Management → Workflow Activity**. The following roles are available for assignment:



Task management icon- Add Task- Workflow-Preparer Reviewer Approved Validator



9 Treatment of FCTR Cashflow

Cashflow TB – FCTR Configuration

Bifurcation of FCTR (Foreign Currency Translation Reserve) component in Cashflow TB.

- **Operating, investing, and financing activities can now be displayed without FCTR amounts.**
- **Added a configuration option to include or exclude FCTR in cashflow reporting.**

This provides greater flexibility and clarity in cashflow presentation, allowing users to tailor reports to business requirements.

9.1 Navigation

Added a new default parameter in Admin → Account Settings → Default Parameters.

- Cashflow FCTR using Gross Movement (New) can now be set to True.
- When enabled, Cashflow TB will calculate FCTR using gross movement logic.

Admin-Account Setting-Default Parameter-Cashflow FCTR using Gross Movement (New)-True
