1. Dynamic Exchange Rate Calculation Enhancement

Overview

Enhanced the currency conversion upload process to automatically calculate missing values based on the combination of uploaded fields.

This enhancement applies to both Segment and TB data uploads (Custom Data service), primarily within the Conversion Book process.

Enhancement Details

The system now supports automatic calculation when any two of the following fields are uploaded:

- Amount
- Base Amount
- Exchange Rate

Based on the uploaded values, the third field will be calculated automatically.

1.1 Supported Calculation Logic

Scenario 1 – Calculate Exchange Rate

When Amount and Base Amount are uploaded:

$\text{Exchange Rate} = \text{Amount} / \text{Base Amount}$

Scenario 2 – Calculate Amount

When Base Amount and Exchange Rate are uploaded:

$\text{Amount} = \text{Base Amount} \times \text{Exchange Rate}$

Scenario 3 – Existing Functionality Retained

When Exchange Rate and Base Amount are uploaded and Amount is not provided, the existing multiplication-based calculation behavior remains unchanged.

Uploaded Fields	System Calculated Field	Formula
Amount + Base Amount	Exchange Rate	$\text{Exchange Rate} = \text{Amount} / \text{Base Amount}$
Base Amount + Exchange Rate	Amount	$\text{Amount} = \text{Base Amount} \times \text{Exchange Rate}$
Amount + Exchange Rate	Base Amount	Existing functionality retained

1.2 Applicability

This enhancement is applicable for:

- Segment Data Uploads
- TB Uploads
- Conversion Book Processing

The functionality is supported in both:

- Base Book
- Target Book

However, operationally it is mainly intended for the Conversion Book, where exchange rate processing is relevant.

1.3 Functional Impact

- Improvements
- Reduces dependency on predefined exchange rate tables
- Supports dynamic exchange-rate-driven calculations from uploaded data
- Improves flexibility during conversion uploads
- Helps address previously observed conversion inconsistencies

2. Audit Reports

Overview

A few new Audit Reports have been introduced to provide visibility into changes made across various entities in the system. This helps in tracking modifications and maintaining accountability.

2.1 Access Configuration for Role level

To enable access to Audit Reports for a user role:

Navigate to:

Admin → User Role Management → Manage Roles → Entitlements → Audit & Other Reports

Identify the required audit reports.

Grant access to the selected reports for the desired role.

2.3 Report Group Audit

Tracks the history of changes to a report pack / workbook container for a tenant and taxonomy: name, purpose (e.g. standard reports vs file-import definitions), linked fact table, viewer type (report vs interactive), and group-level settings (parameters, import/delimiter rules, dashboard layout, publish/share flags).

3. Relationship Master — Order sequence

What it is

In Relationship Master, each RP Association (relationship type—for example Key Management Personnel, Holding Company, Fellow Subsidiary) can now have an Order sequence no.

That number controls the order in which relationship types appear in lists and reports across the application. You set it once in Relationship Master; the same order is used wherever those relationship types are shown in groups.

How to set or change order sequence

1. Go to Admin -> RP Master Setup.
2. Open the Relationship Master tab.
3. In the list, find the RP Association (relationship type) you want to order.
4. Use Add for a new type, or open the action menu and choose Edit for an existing one.

Add RP Association:

RP Association Name *

RP Association Label *

Order sequence no

Save Cancel

Edit RP Association:

RP Association Name *

Associate

RP Association Label *

Associate entities of the Holding Company

Order sequence no

1

Save Cancel

5. Enter a value in Order sequence no:

°Use a positive whole number (for example 1, 2, 3).

6. Save the record.

The Relationship Master grid refreshes and sorts by order sequence (numbered types first, then types with no number).

Rules and tips

- Order sequence no must be a number greater than 0 (decimals and negative numbers are not allowed).
- You may leave Order sequence no empty for types that should appear at the end of the list.
- If two types share the same order sequence number, the application may still show both, but distinct numbers (1, 2, 3, ...) give you predictable control.

What you should expect after setup

1. Open Relationship Master and confirm types appear in the order you want (numbered rows first, in ascending sequence).
2. Run RP Disclosure Report, open the Related Parties tab, and confirm relationship sections match that order.

If a type has no order sequence, expect it **below** all numbered types, not at the top.

4. PDF download of ORT

Earlier Behavior:

Previously, while generating the PDF from Excel:

- The entire workbook was sent to LibreOffice for PDF conversion.
- All sheets were included in the generated PDF, even: non-presentation sheets, hidden sheet, system/control sheets

This sometimes caused:

- unnecessary pages in the PDF
- hidden/internal sheets appearing
- larger PDF size
- confusing output for end users

What We Changed Now

We introduced a filtering mechanism before PDF generation.

New Changes:

- Read the Excel file.
- Check the control sheet: FZ_List_of_Sheets
- Identify sheets marked as "presentation".

Remove:

- non-presentation sheets
- hidden sheets
- very hidden sheets
- Generate PDF only using valid visible presentation sheets.

Additional Improvements

- Added validation for empty Excel files.
- Added detailed logging for removed sheets and conversion failures.
- Added fallback handling:
 - if no valid presentation sheets exist, an empty workbook is generated instead of failing.
- Added LibreOffice path validation.
- Added isolated LibreOffice user profile handling for safer parallel execution.

Navigation Path

Analytics Module → Reports and Dashboards → Live Reports → Excel Disclosure → Actions (report row) → Download Report → PDF

The screenshot displays the 'Reports and Dashboards : Excel Disclosure' page. The table lists reports under the 'Held Treasury' category. The 'Test' report is highlighted, and its actions menu is open.

Report Name	Report Type	Status		Published By	Published On	Actions
		Report	Disclosure			
Financial Statements	LPK02 Excel Report					
Disclosure Notes Test	LPK02 Excel Report					
Test	LPK02 Excel Report			Rakshita OK	12 May 2020 15:44:31	- Email - PDF - Prepare Report - Download Report - View Report - Published Report History - Archive Report - Manage Notes

Final Result

Now the generated PDF contains only the intended visible presentation sheets, making the output:

- cleaner
- smaller
- more secure
- user-friendly
- aligned with presentation requirements
